

Homework number 2

Problem 1: Encrypt works, for some reason I run into an issue on the decrypt where I get garbage values, I am going to work on that more personally and probably ask a TA for help, but the encrypt goes through the DES function just as outlined in lecture 3

Problem 2: Does not work I used the encrypt function from before but the issue I ran into was that it would run into a permutation error so I am also going to work on that more personally.
